Córdoba, Argentina.

Professional summary

I build web applications and websites, creating clear interfaces, robust APIs, and implementing CI/CD processes. Focused on performance, maintainability, and user experience.

I work with a practical, results-oriented approach, adopting new technologies when the problem requires it and continuously optimizing how I design and implement solutions.

Stack:

Core stack: Angular – NestJS – Go – Github – Hostinger – PostgreSQL – Claude AI

Other technologies I work with: JavaScript – MySQL – Postman – VirtualBox – CSS – HTML

Working experience

◆ Invoicing System (Multi-tenant)

Developed a multi-tenant invoicing and inventory platform with role-based access, enabling multiple businesses to manage their data in isolated environments.

Implemented real-time stock updates and movement tracking, ensuring data consistency across sales and inventory modules.

Designed a modular and scalable architecture using NestJS and Angular, supporting maintainability and future feature expansion.

Built RESTful APIs with JWT authentication and structured validation, improving security and reliability of operations.

Integrated an AI-powered assistant using a Retrieval-Augmented Generation (RAG) architecture, enabling users to query application usage through natural language.

Implemented semantic search with vector embeddings stored in PostgreSQL (pgvector), improving accuracy in contextual help responses.

Designed a hybrid AI approach separating documentation-based retrieval from transactional data queries, ensuring reliable and scalable system behavior.

◆ Creativistas Web

Developed a web platform for psychological assessments with dynamic test rendering and automated result processing.

Implemented email delivery system for test results using backend services, ensuring reliable and asynchronous communication.

Designed user flows focused on usability and accessibility, improving completion rates for end users.

Structured backend services to handle form submissions, scoring logic, and result generation efficiently.

◆ Online Store (TiendaNube)

Customized e-commerce themes to match client branding, improving visual consistency and user experience.

Configured complex product variants (attributes, optional selections, conditional options) to support diverse product catalogs.

Optimized checkout flow to reduce friction and improve conversion rates for client-managed stores.
